

Renovation of Philippus Church

Leipzig, Germany

Project Description

The Philippus Church, which was almost in its original state since 1910, is one of the landmark buildings in the west of the city of Leipzig. Its striking elements are, above all, the almost 62-meter-high tower and the numerous neo-Baroque ornaments. Since 2012, the Philippus Church belongs to the Vocational Training Center Leipzig.

In the course of renovation work, Lindner GFT realized the underfloor heating in the nave and the altar area with the NORIT-underfloor heating NORIT-TE 30 Therm GF (gypsum fiber), which combines dry screed and underfloor heating. With a low construction height of only 33 mm, the system was the convincing solution for this refurbishment. After the NORIT-potting compound has been applied, the system can already be walked on after 4 hours and is ready for floor covering after 24 hours, which has positive effects on the construction period.

General

Building Type	Refurbishment, Sacred buildings
Company Division	Lindner Gipsfaser- und Trockenbau
Completion	2019

Completed Works

- **Dry lining**
Underfloor Heating Systems
